

How To Run A Script in R

There are two alternative approaches. Both work as if you were entering all the code in the script one line at a time.

If you need to install R first, go to <http://cran.r-project.org/> for all the files and instructions.

You can run R scripts from the command line using `source("filename.r")`, as explained in http://cran.r-project.org/doc/contrib/Lemon-kickstart/kr_script.html

You can also open the script in R, highlight all of the text with Ctrl-A, and then run it. The figures below show what this looks like in RGUI 2.12.
